**Inclusion Criteria:** Previously healthy children > 6 months with presumed bacterial pneumonia

**Exclusion Criteria:** < 6 months of age (requires hospitalization), respiratory distress or oxygen requirement (requires hospitalization), chronic conditions (i.e., cystic fibrosis, immunodeficiency, living in chronic care facility), concern for aspiration pneumonia, persistence of neonatal cardiac or pulmonary disorder, inpatient status.

**Clinical Findings Suggestive of Pneumonia**
- Tachypnea: RR > 50 - 2-12 mos, > 40 - 1-5 yrs, > 20, 6 yrs and above
- Retractions/increased work of breathing
- Localized abnormal breath sounds (i.e., crackles/rales/tubular breath sounds). Diffuse findings (including wheezing) more suggestive of atypical or viral etiology.
- Fever

**Diagnostic Testing**

For patients not responding to previous therapy, concern for empyema, or when contemplating hospital admission:
- CXR – 2 view
- Blood culture
- CBC, CRP, ESR
- RSV, rapid Influenza A/B, if viral etiology expected

Pulse oximetry spot check, notify MD of sats < 93%

**Antibiotics**

- Amoxicillin 45 mg/kg po BID, wt. < 45 kg (90 mg/kg/day)
- Amoxicillin 2 grams po BID x 10 days po BID, wt. > 45 kg
- If temperature < 39 and atypical organism suspected: Azithromycin 10 mg/kg po day 1, then 5mg/kg po day 2-5
- If using azithromycin for penicillin allergic patient, increase duration of therapy to 7 days
- If labs/blood culture/CXR being ordered and patient being considered for admission, give ceftriaxone 50 mg/kg IM x 1, MAX 2 grams wt. > 40 kg

**Recommendations/Considerations**

- Nov-Mar, < 2 yrs old, with diffuse crackles or wheezing on lung exam, consider viral etiology. If high fever, consider influenza testing and treatment.
- Routine CXRs are not necessary to confirm the diagnosis of suspected community-acquired pneumonia in healthy children with mild disease. CXR findings do not consistently alter patient management and they do not differentiate viral from bacterial etiology. Typical findings may be absent in early disease or in patients with significant dehydration.
- Viral etiologies of CAP have been documented in up to 80% of children younger than 2 years of age

**Criteria for hospitalization:**

- Respiratory distress
- Sustained O2 sat < 90%
- < 6 months of age with suspected bacterial pneumonia
- Children with suspected or documented CAP caused by a pathogen with increased virulence such as MRSA
- Children and infants for whom there is a concern about careful observation at home, who are unable to comply with therapy, or are unable to be followed up should be hospitalized

Approved by Evidence Based Medicine Committee 5/18/16, revised 4/4/17

Reassess the appropriateness of Care Guidelines as condition changes. This guideline is a tool to aid clinical decision making. It is not a standard of care. The provider should deviate from the guideline when clinical judgment so indicates.
